

Use Case Examples

Perfect for Vibe Coding

Personal Projects:

- "Build me a personal blog where I can share photos and stories"
- "Create a simple game for my kids to play"
- "Make a tool to track my exercise routine"

Quick Business Tests:

- "Build a landing page to test if people are interested in my product idea"
- "Create a simple survey tool for customer feedback"
- "Make a basic calculator for my service pricing"

Learning and Exploration:

- "Show me what a modern e-commerce site looks like"
- "Build something that uses AI to analyze images"
- "Create a simple mobile app to understand how they work"

Perfect for Spec Coding

Business Applications:

- "Build a customer management system for my growing business"
- "Create an employee portal with security and user management"
- "Develop a booking system for my service business"

Complex Projects:

- "Build a multi-user platform with different permission levels"
- "Create an application that integrates with multiple external services"
- "Develop a system that handles sensitive customer data"

Team Projects:

- "Build something that multiple developers will work on"
- "Create an application that needs to meet specific compliance requirements"
- "Develop a system that will be maintained and updated for years"

Making the Right Choice

Choose Vibe Coding When:

- You're just starting with an idea
- You want to see possibilities quickly
- You're comfortable with Kiro making technical decisions
- The project is for personal use or testing

You want to know how things will be built

- The project will be used by others or for business
- You need documentation and maintainability
- Security and compliance are concerns
- You want to understand exactly what's being built

Can You Switch Between Them?

Yes! Many successful projects start with vibe coding to explore ideas, then switch to spec coding when they're ready to build the "real" version. Think of vibe coding as sketching and spec coding as creating the final artwork.
