

Step 1: Verify Installation

1. Check Kiro CLI version

```
kiro-cli --version
```

2. Verify authentication status

```
kiro-cli whoami
```

If not authenticated, log in first

```
kiro-cli login --use-device-flow
```

3. Check uv installation (required for MCP servers)

```
uv --version
```

4. Verify AWS credentials (for pricing server; API calls are free)

```
aws sts get-caller-identity
```

Step 2: Create Lab Directory

1. Create workshop directory

```
mkdir /Workshop/amazon-q-agent-lab && cd /Workshop/amazon-q-agent-lab
```

2. Create project structure

```
mkdir -p .kiro/agents
mkdir -p src docs scripts
```

Step 3: Initialize Lab Files

1. Create sample project files

```
echo "# Agent Configuration Lab" > README.md
echo "console.log('Hello from lab');" > src/app.js
echo "# Project Architecture" > docs/architecture.md
```
