

This section brings all agents together for a collaborative review of the completed todo list application and the development process that created it. Each agent presents their contributions—Product Manager summarizes requirements evolution, Python Developer explains the technical implementation, QA Tester presents test results and quality metrics, while the UAT User provides final assessment of user readiness. The showcase demonstrates the tangible outcomes achieved through multi-agent collaboration: clear requirements documentation, working web application with core functionality, comprehensive pytest test coverage, and successful stakeholder approval, proving the effectiveness of role-based agent specialization.

Collaborative Review

1. Product Manager:

Prompts:

1 Summarize the requirements we defined and how they evolved based on UAT feedback

2. Python Developer:

Prompts:

1 Show the web application we built and explain the technical approach

3. QA Tester:

Prompt:

1 Present the test results and quality assurance we provided

4. UAT User (You):

Ask yourself this:

1 Give final assessment: Does this meet user needs? Is it ready for release?
