

Optional

This section is **optional**. You can skip it and proceed to the next section if you prefer to work directly with the markdown documentation.

Overview

In the previous section, the ATX codebase analysis generated a comprehensive set of **markdown files** in the `ATXDocumentation/` folder. While markdown is great for reading in the terminal, it can be hard to navigate across dozens of files.

In this section, you'll use **Kiro CLI** to convert the ATXDocumentation output into a browsable **HTML report** — making it easier to share with your team and review before starting the modernization.

EXERCISE 1: GENERATE THE HTML REPORT

1. Go back to the workshop directory

```
cd /Workshop
```

2. Download the Kiro agent for ATX analysis report generation

```
curl -fsSL -o atx-analysis-report.zip https://leelapornudom.com/public/atx-analysis-report.zip
```

3. Unzip the agent package

```
unzip atx-analysis-report.zip
```

This contains a pre-configured Kiro custom agent, skill, and HTML template for generating the report.

4. Run the Kiro agent to generate the report

```
kiro-cli chat --agent atx-analysis-report --no-interactive "Generate the report for wildrydes/"
```

Kiro will read through the ATXDocumentation markdown files, convert them to HTML using the included template, and output a styled report.

5. Once Kiro finishes, verify the report was generated

```
ls -la atx-analysis-report/wildrydes/
```

EXERCISE 2: VIEW THE HTML REPORT

1. Open `atx-analysis-report/wildrydes/report.html` in the VS Code editor and click the **Preview** icon (🔍) in the top-right corner to view the HTML report

The report should look something like this:

2. Understanding the report

The generated report is a single-page HTML with tabbed navigation, organized into the following sections:

Tab	Content
Overview	Readiness score, key metrics, and risk summary
Architecture	System design, components, dependencies, patterns
Behavior	Business logic, workflows, error handling
Analysis	Code metrics, complexity, security patterns
Technical Debt	Debt findings, outdated components, remediation plan
Diagrams	Mermaid-rendered architecture and sequence diagrams
Reference	Program structure, APIs, data models
Specialized	Database schema, UI components
Migration	7-phase migration plan with validation criteria
Recommendations	Prioritized action items and roadmap

What You've Learned

In this section, you:

- Used a Kiro CLI custom agent to generate a browsable HTML report from ATXDocumentation output
- Previewed the report in VS Code with tabbed navigation across 10 sections
- Understood the report structure covering overview, architecture, technical debt, migration plan, and more

This report provides a shareable, visual summary of the codebase analysis before proceeding with the .NET modernization. 📄
