

Important
Use Kiro **CLI** for this section

1. In the CLI, we will use Kiro to generate a README.md using a prompt

1 Could you create a README file for this application?

2. Review the result

(Optional) Testing and Debugging with Kiro

1. Open your `index.html` file in a web browser to test your Sudoku application
2. If you encounter any issues, use Kiro in VSCode or in the terminal to help debug:

1 "Why isn't this code working as expected?"
2
3 describe your issue...

3. Use Kiro's suggestions to fix any bugs or improve functionality

(Optional) Adding Final Touches

1. Use Kiro to help you add final touches to your application:

Ask Kiro:

1 "How can I improve the user experience of my Sudoku game?"
2 "Can you help me add a timer feature to my Sudoku game?"
3 "How can I save the game state so users can continue later?"

2. Implement the suggestions that you find valuable

(Optional) Example Prompts for Kiro

Here are some example prompts you can use with Kiro to help with specific aspects of your Sudoku application:

- "How do I generate a valid Sudoku puzzle in JavaScript?"
- "Write a function to check if a Sudoku solution is valid"
- "How can I highlight conflicting numbers in my Sudoku grid?"
- "Create a function to save the current game state to localStorage"
- "How do I implement different difficulty levels for my Sudoku game?"

Next Steps

Congratulations! You've created a basic web application with the help of Kiro. In the next lab, you'll learn how to use more advanced prompting techniques to enhance your application.
