

 **Important**
Use Kiro **CLI** for this section

Prerequisites

 **Note**
If you haven't finished [Enhancing the UI with Detailed Prompts](#)

Run the following prompt to create Sudoku game that will be deployed in this lab.

```
1 I want to create a simple html Sudoku game UI with the following features:
2 1. A modern, clean design with a color scheme that reduces eye strain
3 2. A responsive layout that works well on both desktop and mobile devices
4 3. Visual feedback for selected cells, valid/invalid entries, and completed rows/columns/boxes
5 4. A game info panel showing:
6   - Current difficulty level
7   - Timer
8   - Number of mistakes
9   - Completion percentage
10 5. Animations for cell selection and number placement
11 6. Support for both mouse and keyboard input
```

1. Create Infrastructure as Code (IaC) -> Terraform

```
1 Use Terraform to implement infrastructure as code in terraform folder.
2 Using the following AWS solutions:
3 - Host the web application in Amazon S3 private bucket
4 - Deliver the web content through Amazon CloudFront.
```

2. Verify output

Kiro will create the Terraform configuration files and provide instructions to deploy to AWS

WORKSHOP

terraform

main.tf

outputs.tf

terraform.tfvars.example

variables.tf

sudoku.html

APPLICATION BUILDER

PROBLEMS

OUTPUT

DEBUG CONSOLE

TERMINAL

PORTS2

CODE REFERENCE LOG

2. Copy and configure variables:

bash

cp terraform.tfvars.example terraform.tfvars

Edit terraform.tfvars with your unique bucket name

3. Deploy infrastructure:

bash

terraform init

terraform plan

terraform apply

The Sudoku game will be accessible via the CloudFront URL shown in the outputs, while the S3 bucket remains private.
