

Important
Use Kiro **CLI** for this section

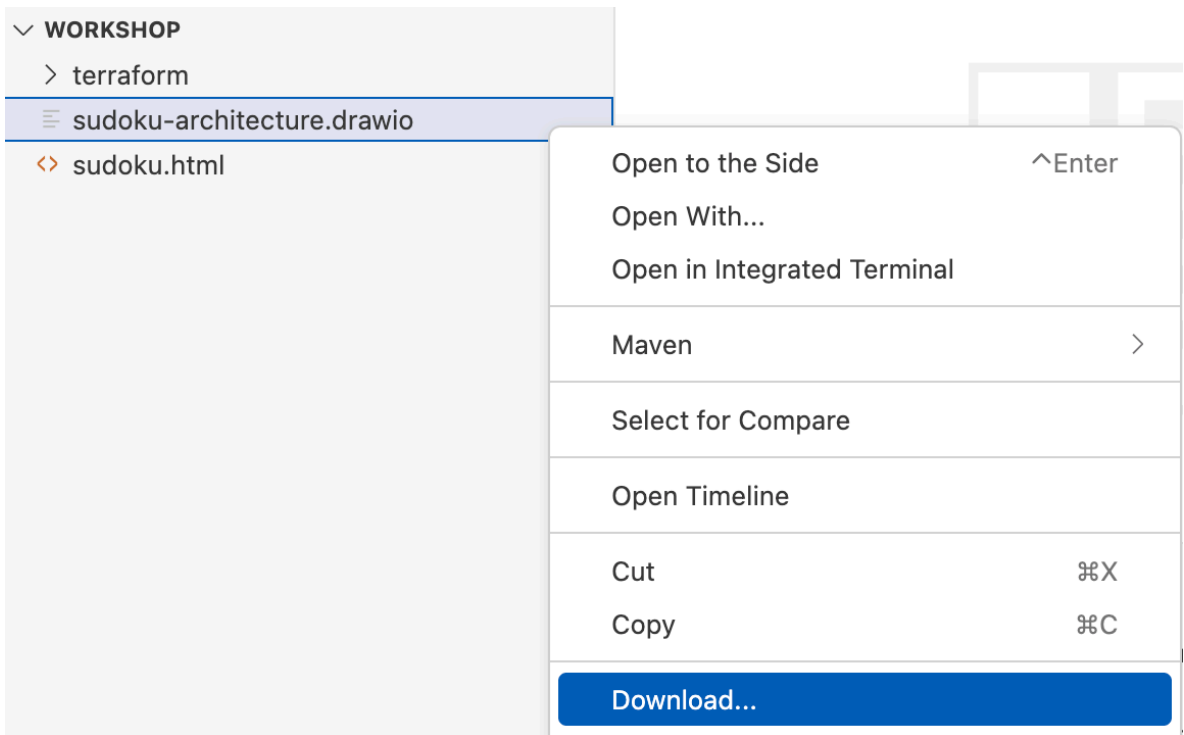

1. Generate an architecture diagram in draw.io format

- 1 Please generate an architecture diagram for this Terraform application that I can load in drawio.
- 2 Please verify,
- 3 1. You choose the correct AWS and Terraform Icon.
- 4 2. All components can display corectly.
- 5 3. If you not sure which Icon to use then you can use generic Icon. But prefere to use AWS and Terraform Icon as first priority.
- 6 4. Please create with transparent background.

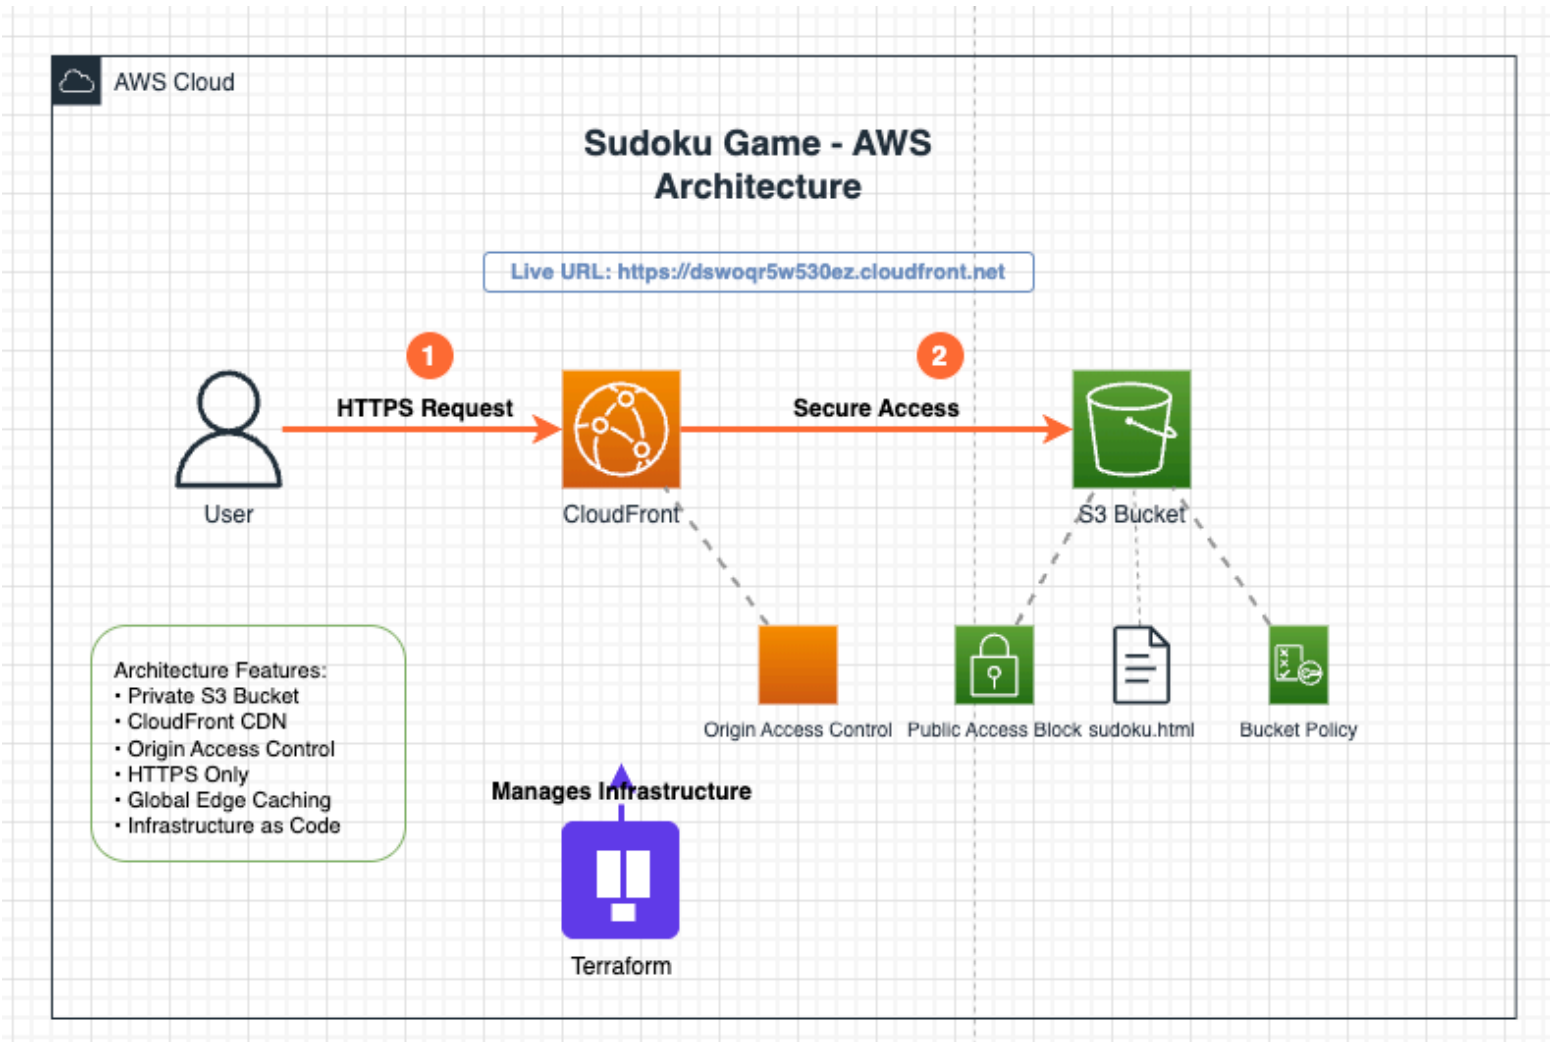

```
> Please generate an architecture diagram for this Terraform application that I can load in drawio.
Please verify,
1. You choose the correct AWS and Terraform Icon.
2. All components can display corectly.
3. If you not sure which Icon to use then you can use generic Icon. But prefere to use AWS and Terraform Icon as first priority.
4. Please create with transparent backgroud
> I'll create a draw.io architecture diagram using the standard AWS4 icon library that's built into draw.io, with transparent background.
✖ Using tool: fs_write (trusted)
```

2. Download the draw.io output file

3. Open draw.io in a web browser

Open via [draw.io](#)

(Optional) Advanced Topics: Ask Anything About Kiro!!

If you have time, you can explore these advanced topics with Kiro:

1. Setting up a custom domain name:

- 1 How do I configure a custom domain name for my CloudFront distribution using Terraform?

2. Implementing CI/CD for automatic deployments:

- 1 How can I set up a GitHub Actions workflow to automatically deploy my Sudoku app using Terraform when I push changes?

3. Adding monitoring and analytics:

- 1 How can I add monitoring and analytics to my deployed Sudoku application using Terraform?
