

**Important**

- Use Kiro CLI for this section
- Complete the [Setting Up Kiro](#) section

Learn how to configure AWS MCP servers with Kiro CLI to enable enhanced capabilities for diagram generation, infrastructure validation, pricing analysis, and documentation access.

**AWS MCP Server** is a suite of specialized MCP servers that help you get the most out of AWS.

In this section, we will use the following MCP server:

- **uv (Python package installer) <- If you run on your own environment**

1. In your VS Code Server environment, create a new folder to separate context from other files inside VS Code Server and download image:

```
1 cd /Workshop
2 mkdir mcp
3 cd mcp
4 curl https://d1qb3b3nm7048z.cloudfront.net/q-dev-build-to-operate-diagram.jpg -o aws-diagram.jpg
```

You will see `aws-diagram.jpg` in `mcp` folder

2. To configure MCP via Kiro CLI, edit `~/.kiro/settings/mcp.json` file

```
1 # Create mcp.json file with the specified content
2 cat > ~/.kiro/settings/mcp.json << 'EOF'
3 {
4   "mcpServers": {
5     "awslabs.core-mcp-server": {
6       "command": "uvx",
7       "args": [
8         "awslabs.core-mcp-server@latest"
9       ],
10      "env": {
11        "FASTMCP_LOG_LEVEL": "ERROR"
12      },
13      "autoApprove": [],
14      "disabled": false
15    },
16    "awslabs.aws-diagram-mcp-server": {
17      "command": "uvx",
18      "args": ["awslabs.aws-diagram-mcp-server"],
19      "env": {
20        "FASTMCP_LOG_LEVEL": "ERROR"
21      },
22      "autoApprove": [],
23      "disabled": false
24    },
25    "awslabs.terraform-mcp-server": {
26      "command": "uvx",
27      "args": ["awslabs.terraform-mcp-server@latest"],
28      "env": {
29        "FASTMCP_LOG_LEVEL": "ERROR"
30      },
31      "disabled": false,
32      "autoApprove": []
33    },
34    "awslabs.aws-pricing-mcp-server": {
35      "command": "uvx",
36      "args": [
37        "awslabs.aws-pricing-mcp-server@latest"
38      ],
39      "env": {
40        "FASTMCP_LOG_LEVEL": "ERROR",
41        "AWS_PROFILE": "your-aws-profile",
42        "AWS_REGION": "us-east-1"
43      },
44      "disabled": false,
45      "autoApprove": []
46    },
47    "awslabs.aws-documentation-mcp-server": {
48      "command": "uvx",
49      "args": ["awslabs.aws-documentation-mcp-server@latest"],
50      "env": {
51        "FASTMCP_LOG_LEVEL": "ERROR",
52        "AWS_DOCUMENTATION_PARTITION": "aws"
53      },
54      "disabled": false,
55      "autoApprove": []
56    }
57  }
58 }
59 EOF
60
61 echo "MCP configuration file created at ~/.kiro/settings/mcp.json"
```

## MCP Server Details

- **Core MCP Server**: A starting point for using AWS MCP servers through a dynamic proxy server strategy based on role-based environment variables.
- **AWS Pricing MCP Server**: Accessing real-time AWS pricing information and providing cost analysis capabilities
- **AWS Terraform MCP Server**: Terraform on AWS best practices, infrastructure as code patterns, and security compliance with Checkov.
- **AWS Diagram MCP Server**: Generate and Customization AWS Diagrams
- **AWS Documentation MCP Server**: access AWS documentation, search for content, and get recommendations.

3. Start Kiro CLI to check if the MCP server is properly configured. If MCP is configured correctly, you should see the message below

```
1 kiro-cli chat
```

You will see 5 MCP servers loaded successfully

## Summary

You have successfully configured 5 AWS MCP servers with Kiro CLI. These servers provide specialized capabilities for diagram generation, Terraform validation, pricing analysis, and AWS documentation access. With the MCP servers properly loaded, you're now ready to leverage their enhanced functionality in the following sections.
