

Transform hand-drawn sketches or whiteboard diagrams into professional AWS architecture diagrams using Kiro CLI's multimodal capabilities and MCP diagram server.

Related MCP Server:

- [AWS Diagram MCP Server](#): Generate and Customization AWS Diagrams

1. Starting from an idea, whether from hand-drawn images on a whiteboard or on blank paper, to an AWS diagram

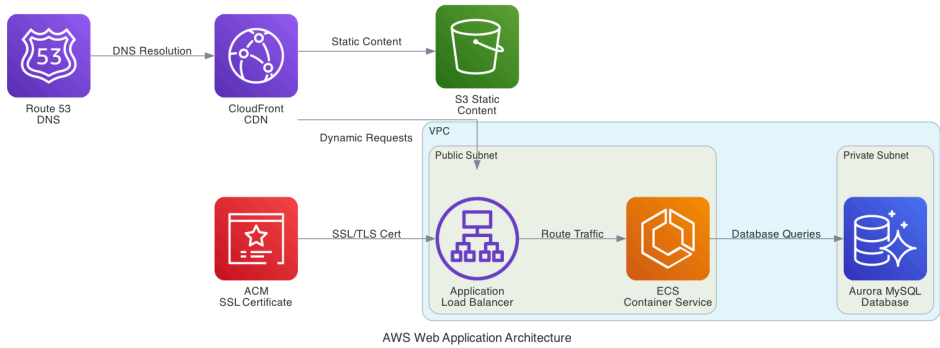

1 Read the AWS diagram at aws-diagram.jpg and create a AWS architecture diagram with edge label (labeled connections) using diagram mcp server

This leverages the multimodal capabilities of Kiro CLI, which can read and understand images. After that, it calls MCP `aws-diagram-mcp-server`. You can press `t` or `y` to continue the process.

```
✂ Using tool: list_icons from mcp server awslabs.aws-diagram-mcp-server
• Running list_icons with the param:
  {
    "provider_filter": "aws"
  }
Allow this action? Use 't' to trust (always allow) this tool for the session. [y/n/t]:
> t
```

`aws-diagram-mcp-server` will convert that image into an AWS diagram. The resulting output will be as shown in the image

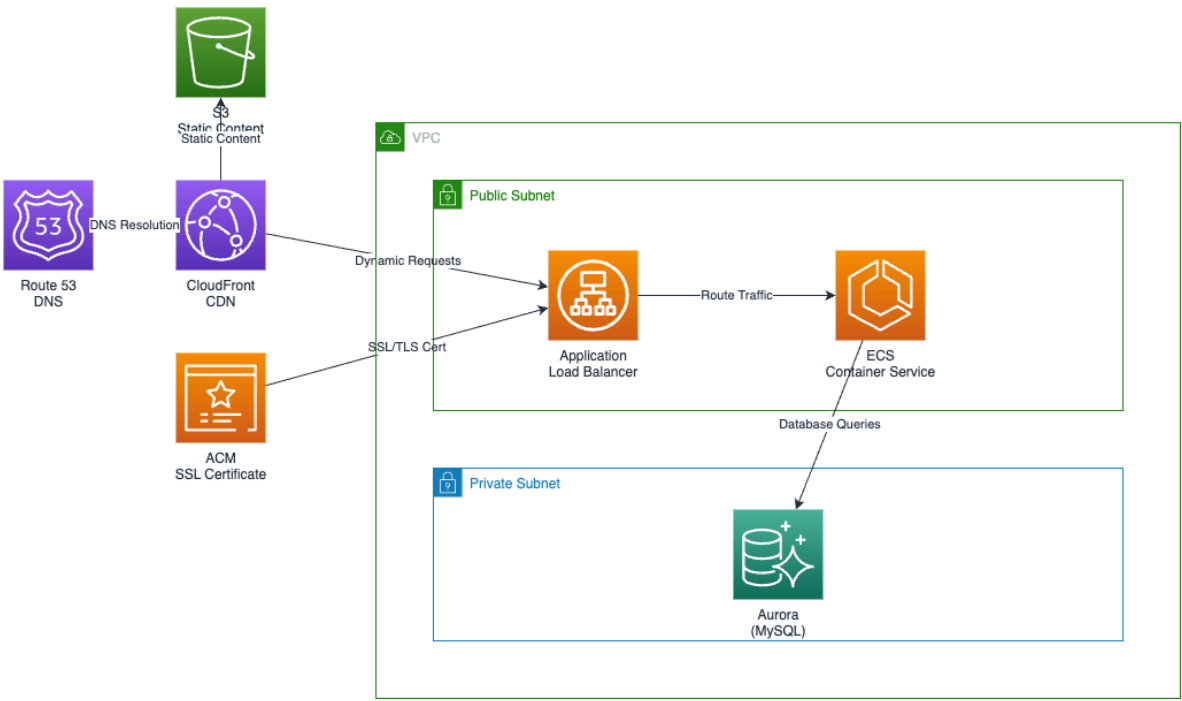

2. If you want it in Draw.io format, you can add the following to the prompt:

1 Create a draw.io xml file for the diagram

This prompt will create a draw.io file that can be imported into draw.io. The result will be approximately like the image below.

Note: The resulting diagram may vary and might not be identical to what is shown below. You will notice that Kiro does not need to use `aws-diagram-mcp-server` to generate draw.io format.

Summary

You have successfully transformed a hand-drawn diagram into professional AWS architecture diagrams using Kiro CLI's multimodal capabilities. The MCP diagram server converted your image into both standard AWS diagrams and Draw.io format, demonstrating how AI can bridge the gap between conceptual sketches and formal technical documentation.
