

Estimate deployment costs and get optimization recommendations using MCP AWS Pricing server to analyze your infrastructure before deployment.

Related MCP Server:

- [AWS Pricing MCP Server](#): Accessing real-time AWS pricing information and providing cost analysis capabilities

After obtaining the Terraform code to deploy this solution, before deployment we want to know how much it will cost if we deploy according to this plan. We can use MCP `aws-pricing-mcp-server` to help with this.

1. `aws-pricing-mcp-server` has multiple tools for querying pricing data from the AWS Pricing API for any AWS service. In this example, we will perform preliminary cost estimation.

1 Determine an estimate on how much this architecture will cost, save the report as `cost.md` file

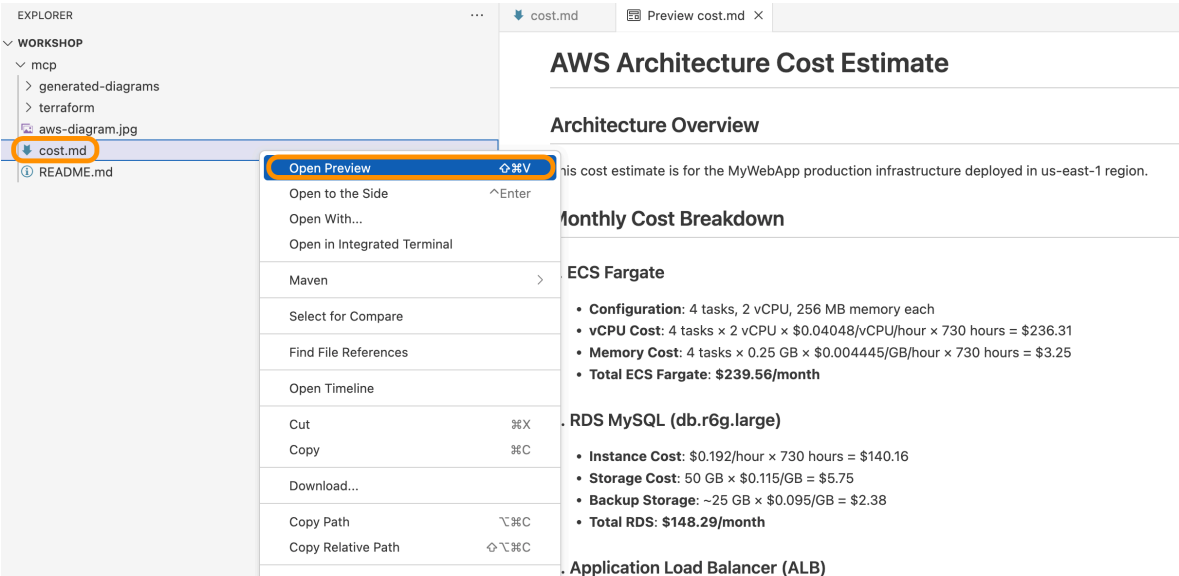

Kiro will use `aws-pricing-mcp-server` to get pricing for this project.

```
✂ Using tool: get_pricing_service_codes from mcp server awslibs.aws-pricing-mcp-server
...
• Running get_pricing_service_codes with the param:
... {
...   "filter": "fargate"
... }

Allow this action? Use 't' to trust (always allow) this tool for the session. [y/n/t]:
> t
```

Kiro also includes recommendations for cost optimization and saved it as `cost.md`

Summary

You have successfully analyzed the cost implications of your architecture using MCP AWS Pricing server. The analysis provided detailed cost estimates and optimization recommendations, enabling informed decision-making before deployment. This proactive approach helps avoid unexpected costs and ensures budget-conscious infrastructure planning.
