

Kiro for command line has support for connecting to MCP (Model Context Protocol) servers. This allows you to extend Q's capabilities by connecting to external and or custom tools. In this lab, you will learn how to setup and leverage this capability.

What is MCP?

MCP is an open protocol that standardizes how applications provide context to LLMs. Think of MCP like a USB-C port for AI applications. Just as USB-C provides a standardized way to connect your devices to various peripherals and accessories, MCP provides a standardized way to connect AI models to different data sources and tools.

Why it matter to me?

MCP enables the Kiro CLI to connect with external tools and data sources. This allows the CLI to perform complex tasks in real-world environments. Through MCP, the CLI expands beyond AWS and tools knowledge by accessing, analyzing, and acting on current information from your environment. This makes its assistance more relevant and powerful, tailored to your specific needs.
