

What This Step Adds

The steering file from 3.1 tells Kiro *this project's* context. Now add a skill that bundles team-wide Terraform standards and defines *how* to review: a multi-step workflow with automated tag checks, compliance scoring, and a PR-ready output template.

Skills can bundle more than just instructions. The [agentskills.io specification](#) supports three optional directories: `scripts/` for executable checks, `references/` for documentation, and `assets/` for templates. This skill uses all three.

Create the Skill

Step 1: Create the skill directory structure:

macOS / LinuxWindows (PowerShell)

```
1 mkdir -p .kiro/skills/tf-plan-review/scripts
2 mkdir -p .kiro/skills/tf-plan-review/references
3 mkdir -p .kiro/skills/tf-plan-review/assets
```

The skill directory will look like this:

```
tf-plan-review/
├── SKILL.md           # Required: workflow instructions
├── scripts/
│   ├── check_tags.sh  # Tag checker (macOS/Linux)
│   └── check_tags.ps1  # Tag checker (Windows)
├── references/
│   ├── terraform-standards.md # Team-wide Terraform standards
│   └── approved-sizes.md      # Team-approved instance types
└── assets/
    └── pr-comment.md         # PR review comment template
```

Step 2: Download the supporting files to reduce copy-paste:

macOS / LinuxWindows (PowerShell)

```
1 curl -L https://static.us-east-1.prod.workshops.aws/af1c254a-b9ac-4348-8666-b30de0f3e9aa/static/skills/tf-plan-review-files.zip?Key-Pair-Id=K36Q2WV03JP7QD&Policy=arn:aws:iam::111111111111:policy/AmazonS3OutpostsAccessPolicy --output /tmp/tf-plan-review-files.zip
2 unzip -o /tmp/tf-plan-review-files.zip -d .kiro/skills/tf-plan-review/
3 rm /tmp/tf-plan-review-files.zip
```

🔔

What's in the zip
The zip contains: `scripts/check_tags.sh`, `scripts/check_tags.ps1`, `references/terraform-standards.md`, `references/approved-sizes.md`. You'll create `SKILL.md` and `assets/pr-comment.md` manually - these are the key learning artifacts.

Step 3: Create `.kiro/skills/tf-plan-review/SKILL.md` (Open **terminal** if not exist and run `kiro .kiro/skills/tf-plan-review/SKILL.md` in it):

```
1 ---
2 name: tf-plan-review
3 description: >
4   Review Terraform code or plan output using a structured workflow.
5   Produces a findings table, compliance score, and PR-ready review
6   comment. Use when reviewing .tf files, terraform plan output,
7   or preparing infrastructure changes for approval.
8 ---
9
10 # Terraform Plan Review Workflow
11
12 ## Step 1: Read and Understand
13 - Read the target .tf file(s) or plan output
14 - Identify all resources, data sources, and modules
15 - Note the provider versions and backend configuration
16
17 ## Step 2: Run Automated Checks
18 - Execute `kiro/skills/tf-plan-review/scripts/check_tags.sh` (or `ps1` on Windows) to verify required tags
19 - Review the script output for any missing tags
20
21 ## Step 3: Check Against Standards
22 - Load `kiro/skills/tf-plan-review/references/terraform-standards.md` for team-wide rules
23 - Load the project's steering files for project-specific conventions
24 - Check each resource against both team standards and project context
25 - Reference `kiro/skills/tf-plan-review/references/approved-sizes.md` for instance type validation
26 - Do NOT invent rules: only flag violations of documented standards
27
28 ## Step 4: Assess Beyond Standards
29 - Check for general security risks (publicly exposed resources, missing lifecycle rules)
30 - Identify potential cost issues (oversized instances, unused resources)
31 - Flag reliability gaps (no multi-AZ, missing health checks, no backups)
32
33 ## Step 5: Produce Output
34
35 ### Findings Table
36 | # | Severity | Resource | Category | Finding | Recommendation |
37 |---|-----|-----|-----|-----|-----|
38
39 Severity levels: Critical, Warning, Info
40 Categories: Security, Cost, Compliance, Reliability, Best Practice
41
42 ### Compliance Score
43 Calculate: (total checks passed / total checks) x 100
44 - 90-100%: Ready to merge
45 - 70-89%: Needs fixes before merge
46 - Below 70%: Significant rework required
47
48 ### PR Review Comment
49 Use the template from `kiro/skills/tf-plan-review/assets/pr-comment.md`
```

Step 4: Create `.kiro/skills/tf-plan-review/assets/pr-comment.md` (Open **terminal** if not exist and run `kiro .kiro/skills/tf-plan-review/assets/pr-comment.md` in it):

```
1 ## Infrastructure Review Summary
2 Score: [percentage] | Risk: [HIGH/MEDIUM/LOW]
3 Findings: [X] critical, [Y] warning, [Z] info
4
5 ### Action Required
6 - [ ] Fix: [description]
7
8 ### Recommendations
9 - [ ] Consider: [description]
10
11 ---
12 _ Reviewed by tf-plan-review skill _
```

Test It

Step 5: Test the skill with the same `sample-infra.tf` from step 3.1:

```
Review sample-infra.tf for security issues and compliance.
```

If the skill does not activate automatically, invoke it directly:

```
/tf-plan-review Review sample-infra.tf
```

Step 6: Compare the output with step 3.1. You should now see:

- Automated tag check results from the script
- Instance types validated against the approved sizes reference
- A numbered findings table with Severity, Resource, Category, Finding, and Recommendation
- A compliance score percentage with a pass/fail verdict
- A PR-ready review comment from the template

🔔

Steering vs Skills
The EOL skill in Section 2 had 2 files. This skill has 6 files across 3 directories. The skill is still portable - you can zip it and share it with another team. The scripts run automated checks, the references encode team standards, and the assets provide output templates.

⚠️

What's Next
You now have structured output with compliance scoring. But the review relies on Kiro's built-in knowledge for provider details. In the next step, you'll build a Power that adds real Terraform Registry lookups and Checkov scanning via MCP tools.
