

 Optional Section

This section is optional. It builds on the core concepts from Section 2 using a Terraform infrastructure review use case. Create a new directory (`lab07-section3/`) and open it in Kiro IDE as a fresh workspace.

Advanced Patterns: Build an Infra Reviewer

In Section 2, you learned the core concepts by building an EOL Reporting agent. Each layer (Steering, Skill, Agent) has additional capabilities that unlock more powerful workflows. Now you'll see those advanced patterns in action by building a 4-layer **Infrastructure Code Reviewer** for Terraform:

#	Layer	New Pattern (vs Section 2)	Result
3.1	Steering	<code>fileMatch</code> mode (loads only for <code>.tf</code> files)	Kiro knows your project details only when reviewing Terraform
3.2	Skill	<code>scripts/</code> + <code>references/</code> + <code>assets/</code> directories	Automated tag checks, team standards, PR-ready output
3.3	Power	Build from scratch (<code>POWER.md</code> + <code>mcp.json</code> + <code>steering/</code>)	Kiro auto-activates MCP tools for Terraform keywords
3.4	Custom Agent	<code>includePowers</code> + parallel subagent invocation	A specialized agent that reviews multiple files concurrently

Follow the steps in order. Each exercise builds on the previous one. By the end, you will have a fully equipped infra-reviewer.
