

Congratulations on completing the Kiro workshop! Throughout this hands-on experience, you've explored how AI can transform your development workflow and accelerate your journey from code to cloud.

What You've Learned

- **Setting Up Kiro:** You've configured Kiro in both your IDE and CLI environments, giving you AI assistance across your development workflow.
- **AI-Assisted Development:** You've experienced firsthand how Kiro can help generate code, answer technical questions, and provide contextual recommendations as you build applications.
- **Web Application Creation:** You've built a basic web application with Kiro's assistance, learning effective prompting techniques to get the most helpful responses.
- **Advanced Prompting Skills:** You've mastered more sophisticated ways to interact with Kiro to solve complex development challenges and improve code quality.
- **Cloud Deployment with CDK:** You've deployed your application to AWS using infrastructure as code principles with CDK, setting up CloudFront and S3 for hosting.
- **Cloud Operations:** You've learned how Kiro CLI can simplify AWS resource management, help analyze CloudFormation stacks, implement VPC flow logs, and optimize network configurations.
- **Security Enhancement:** You've discovered how to use Kiro to strengthen your AWS account security by performing comprehensive security assessments, analyzing templates for vulnerabilities, and implementing best practices aligned with the AWS Well-Architected Framework.
- **Financial Optimization:** You've learned how to leverage Kiro to identify cost-saving opportunities, optimize resource utilization, and implement financial best practices to maximize the efficiency of your AWS environment.
- **Context-Aware Development:** You've explored how to enhance Kiro's capabilities using context files and profiles to customize its behavior according to your specific development preferences, coding standards, and architectural patterns.
- **Practical Problem-Solving:** Through the coding challenge, you've applied your new skills to build a shopping cart API following clean architecture and TDD principles using AWS services like Lambda, API Gateway, and DynamoDB.

Next Steps

- Continue exploring Kiro in your daily workflow
- Experiment with different prompting techniques for various development tasks
- Apply clean architecture and TDD principles in your projects with Kiro's assistance
- Use Kiro to simplify your cloud operations and infrastructure management
- Implement security best practices using Kiro's security assessment capabilities
- Create custom context files and profiles to tailor Kiro's behavior to your specific needs
- Share your experience and knowledge with your team
- Stay updated on new Kiro features and capabilities

Thank you for participating in this workshop! We hope you'll apply these skills to enhance your productivity and accelerate your development projects.
