

If you are attending an AWS-hosted event, you will have access to a temporary AWS account provisioned through AWS Workshop Studio. This account is pre-configured with the necessary permissions and will be automatically cleaned up after the event concludes.

What is Workshop Studio?

AWS Workshop Studio is a platform that provides temporary AWS accounts for workshop participants. These accounts come with:

- Pre-configured IAM permissions for workshop activities
- Automatic resource cleanup after the event
- No cost to participants
- Isolated environment for safe experimentation

Step 1: Access Your Workshop Studio Event Dashboard

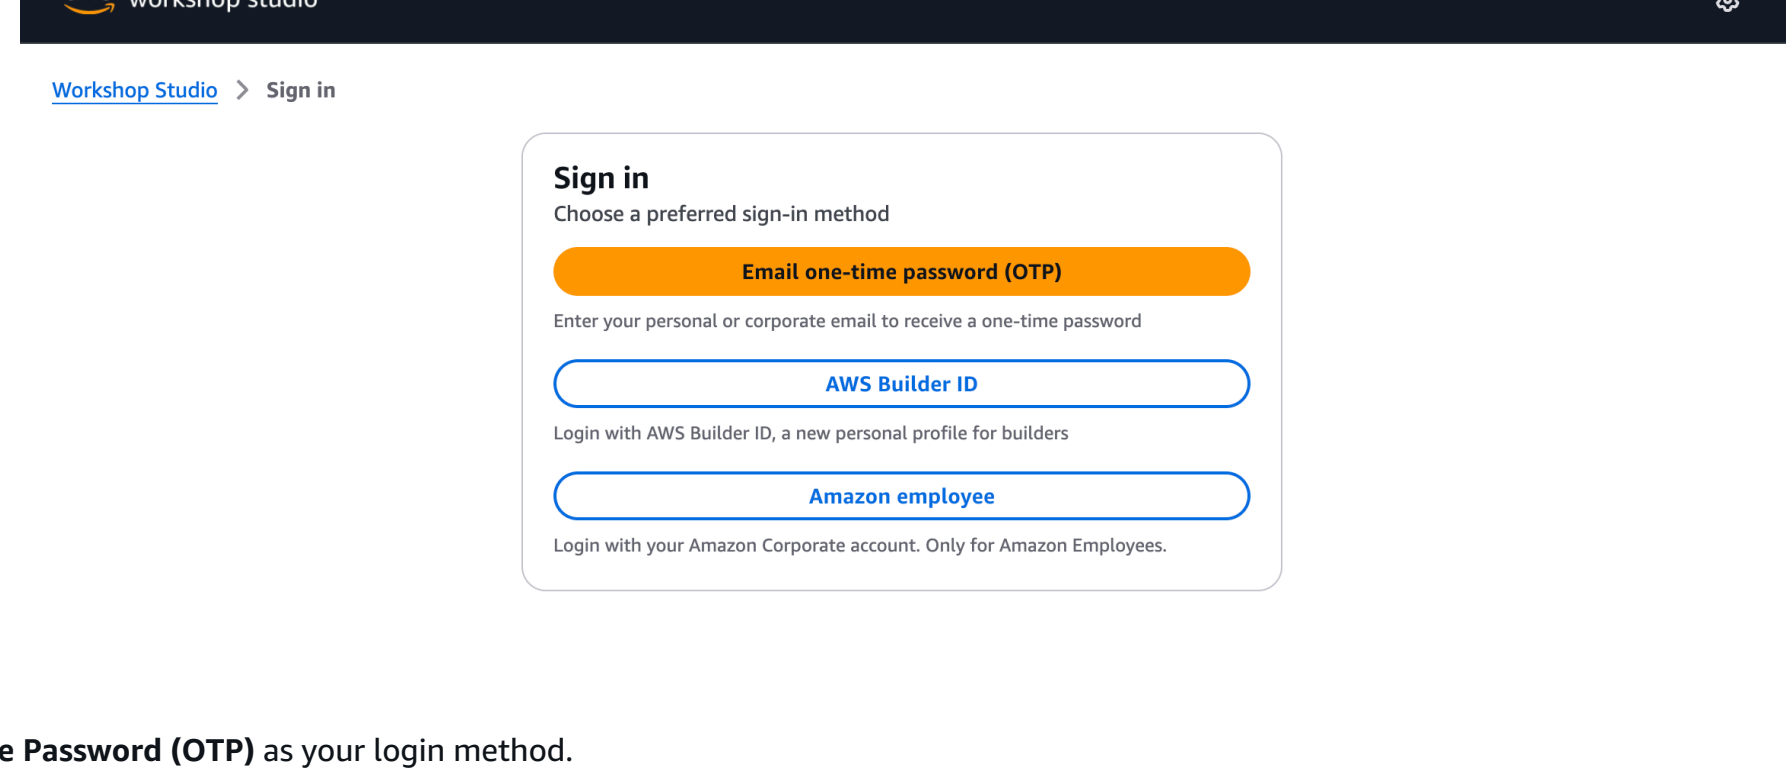

Join the Event

You will receive one of the following from your workshop facilitator:

- **One-click join event link** - Direct access link with embedded event code
- **Workshop Studio join URL** with a **12-digit event access code**

Sign In

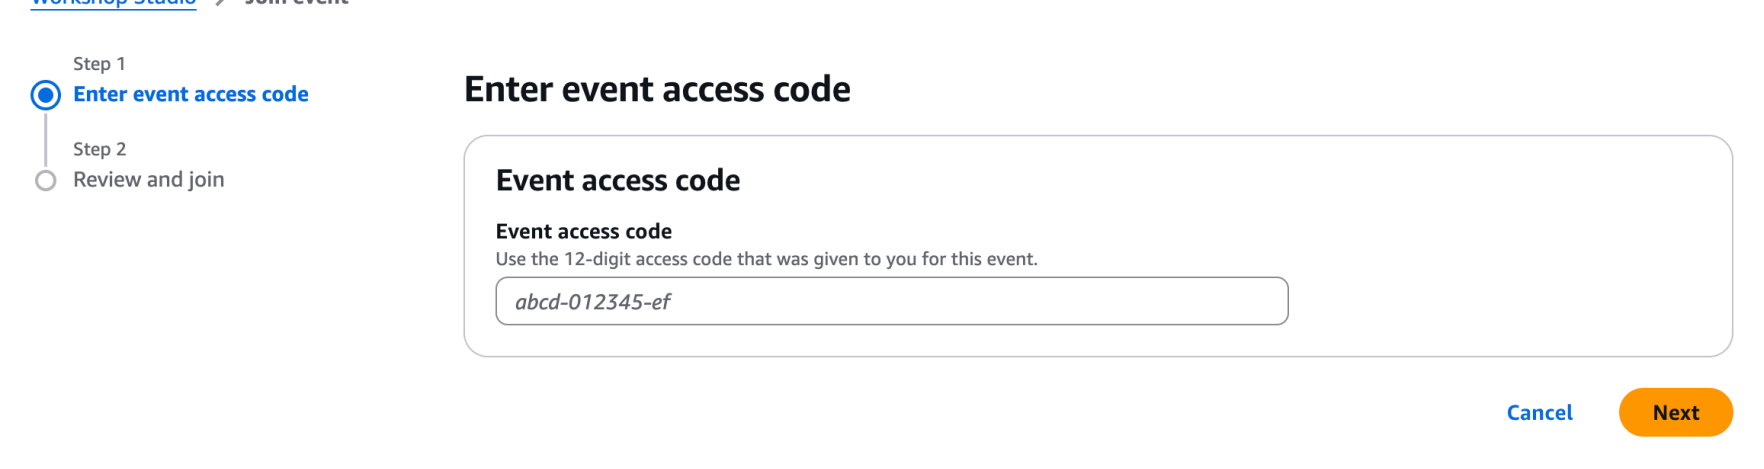

1. Navigate to <https://catalog.prod.workshops.aws/join>

2. Choose **Email One Time Password (OTP)** as your login method.
3. Check your email for the one-time password.
4. Enter the OTP to complete login.

Enter Event Access Code

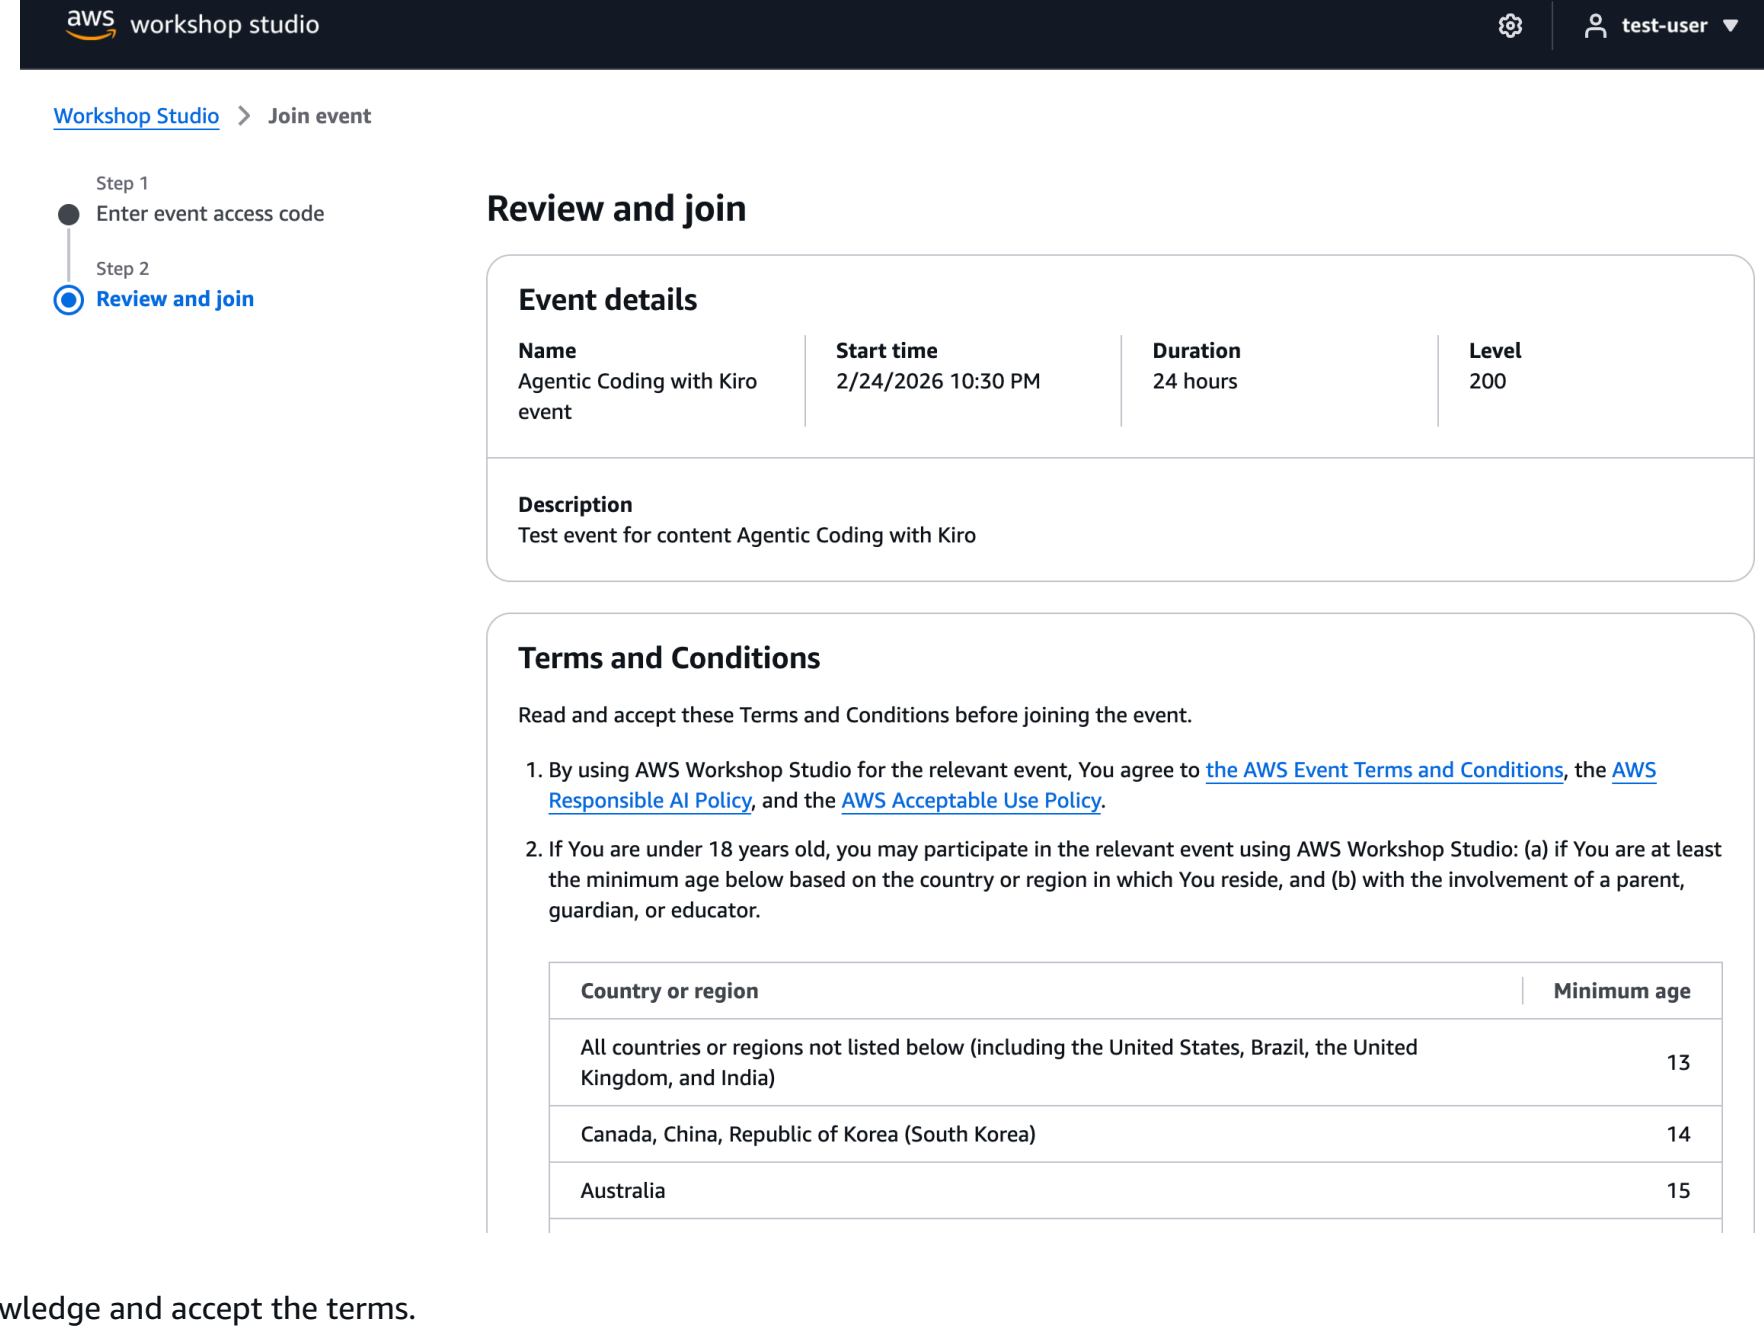

After successful OTP login, you will be navigated to the Join Event page.

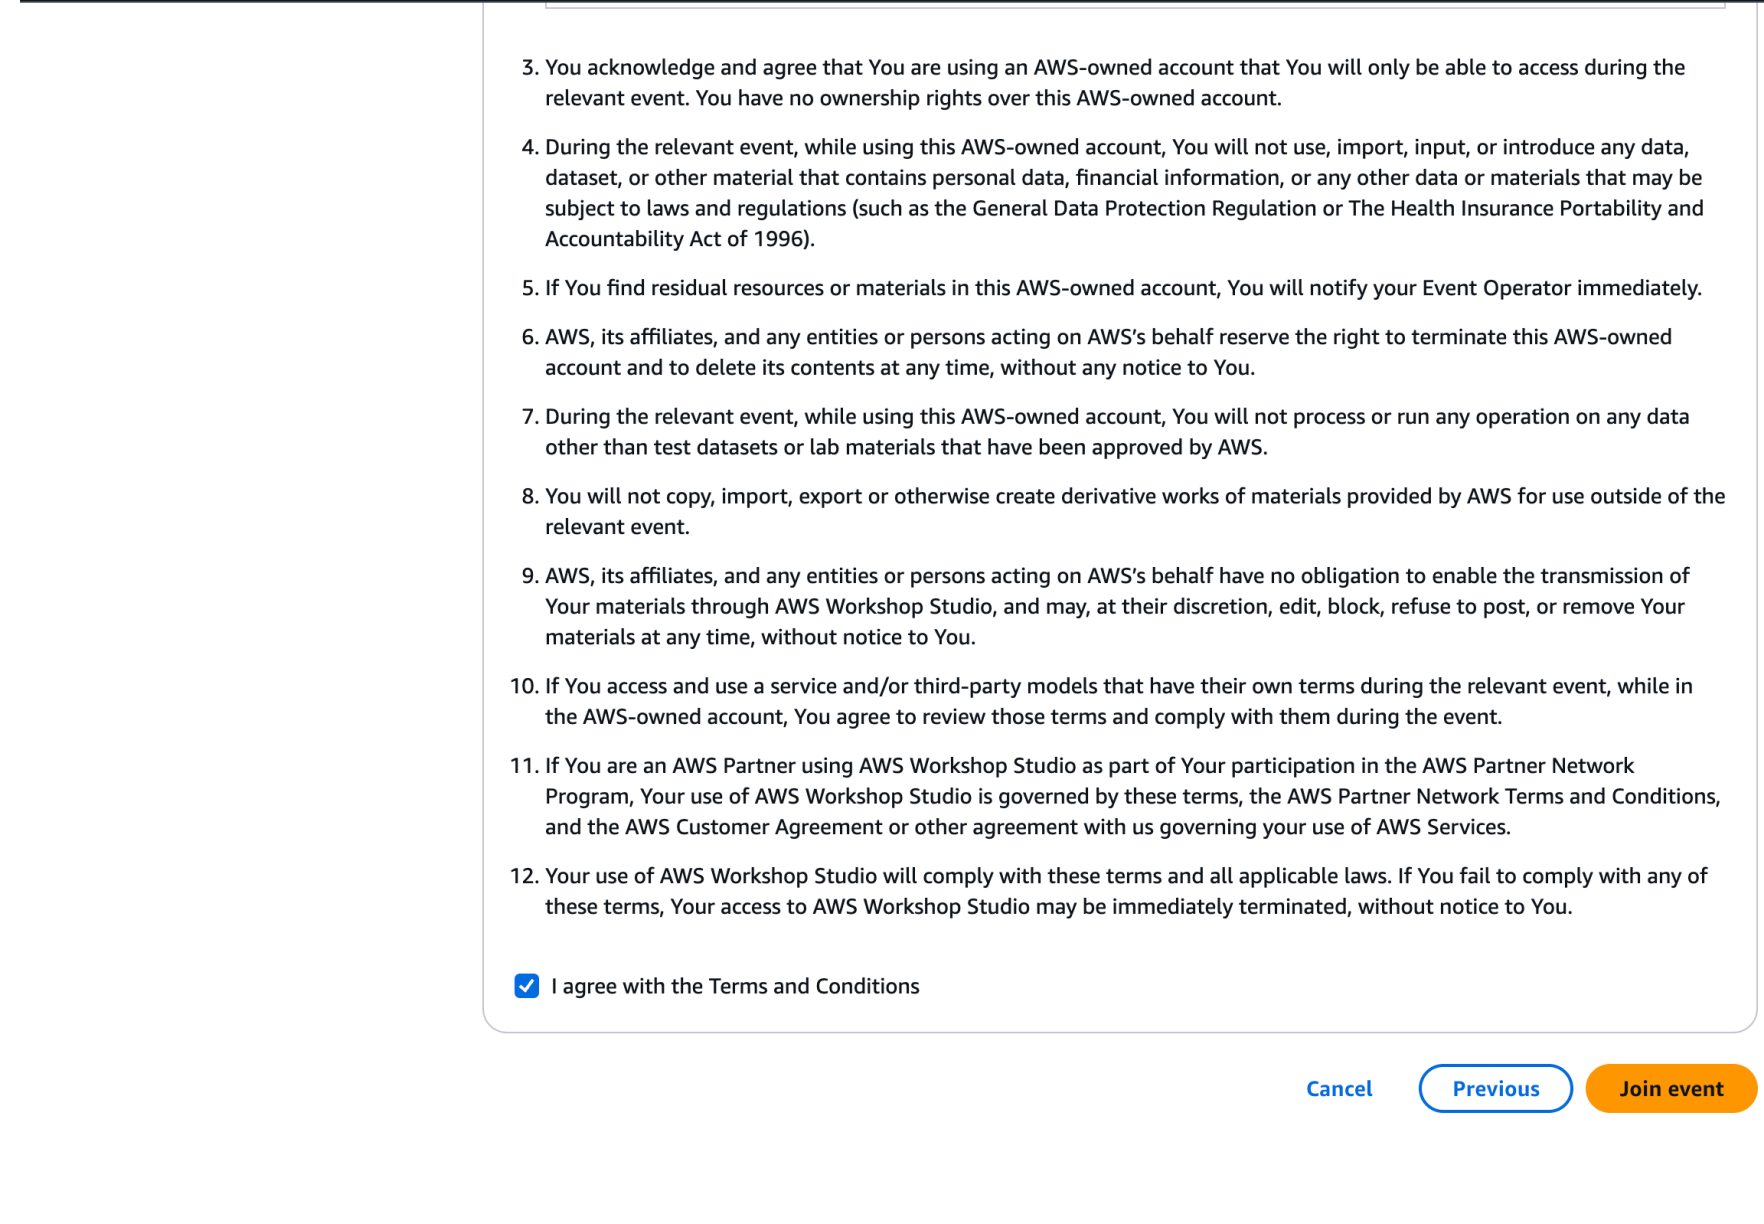

- If you used a **one-click join link**, the event access code will be automatically populated
- If you used the **generic join URL**, enter the **12-digit event access code** provided by your workshop facilitator

Accept Terms and Conditions

1. Review the workshop terms and conditions carefully.

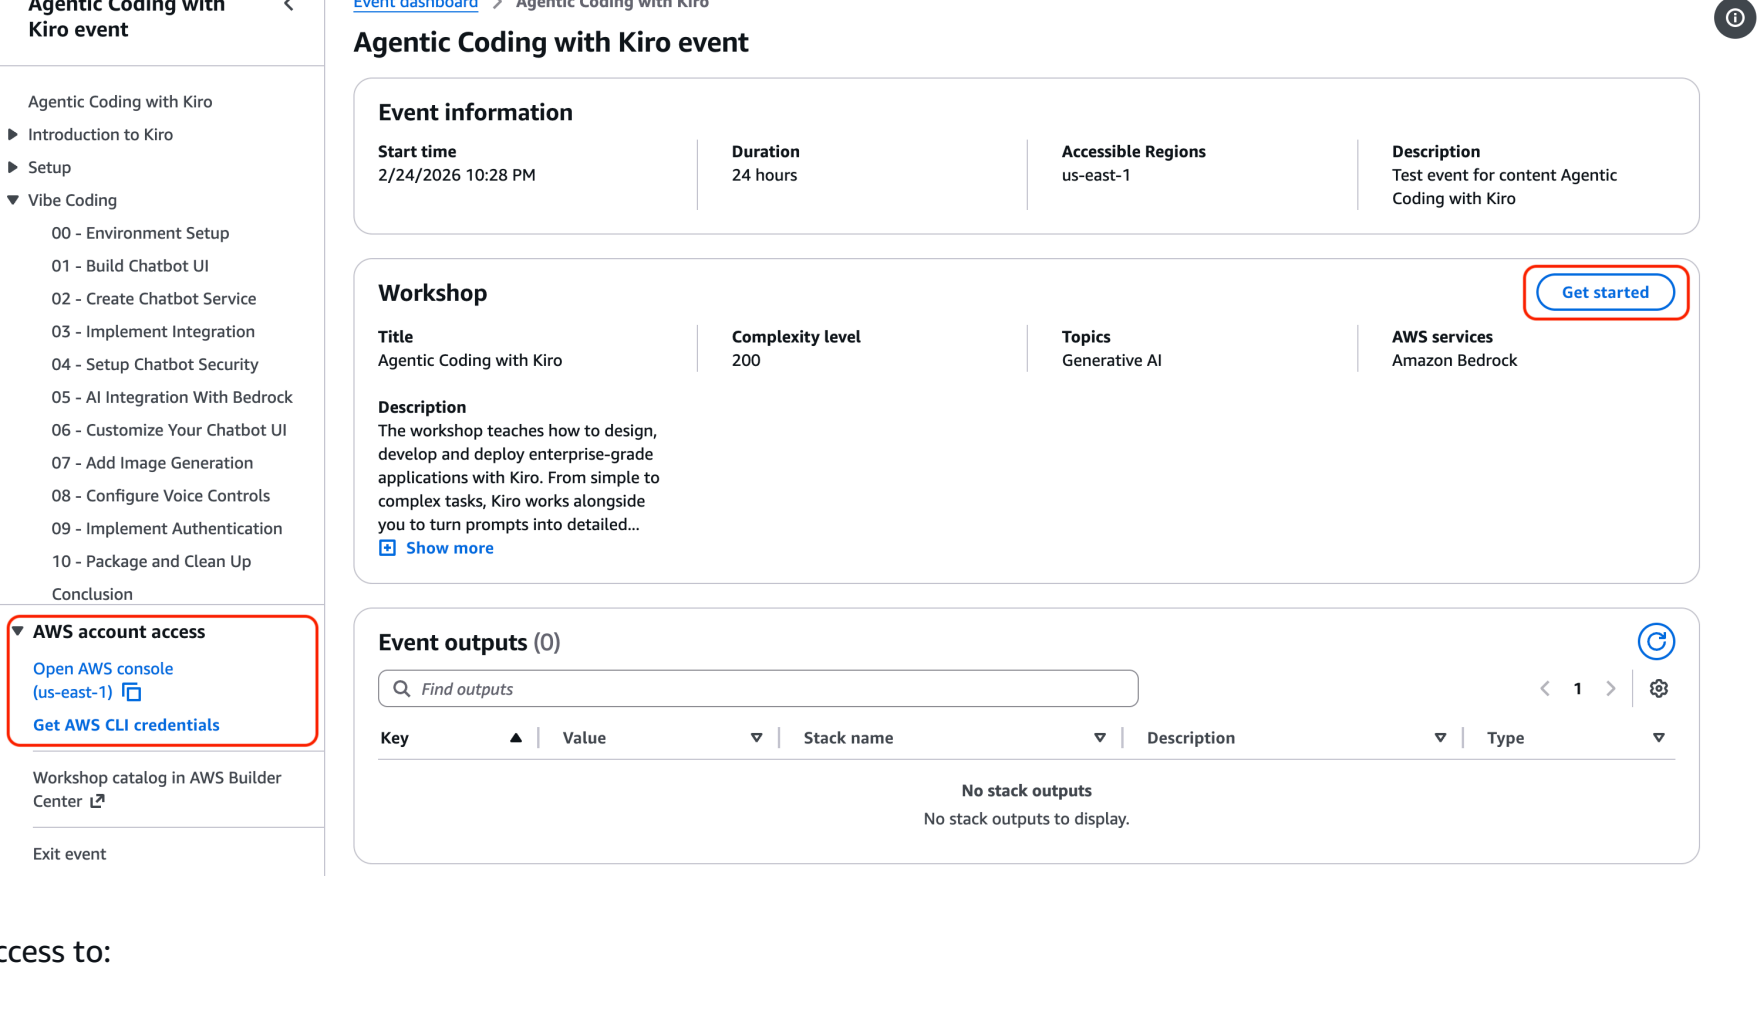

2. Check the box to acknowledge and accept the terms.
3. Click the button to proceed to the workshop.

Event Dashboard

After accepting the terms and conditions, you will see the Event Engine dashboard.

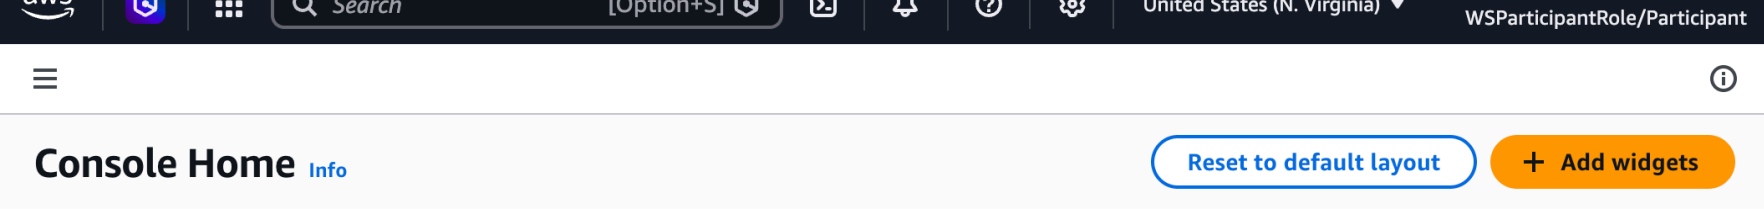

The dashboard provides access to:

- **Get Started** button - Navigate to workshop instructions
- **AWS Console** - Access your Workshop Studio provisioned AWS account
- **AWS CLI credentials** - AWSCLI credentials for command-line access to Workshop Studio provisioned AWS account

Step 2: Access AWS Console

1. From the Event Engine dashboard, click on the **Open AWS console** link.
2. The AWS Console link will open the AWS Management Console home page. This is the standard AWS Console that provides access to each service.

- **Important**
 - The infrastructure associated with the workshop will be deployed to a specific region and can only be accessed from that region
 - Ensure that you are logged in as **WSParticipantRole**, as can be verified on the top right of the screen

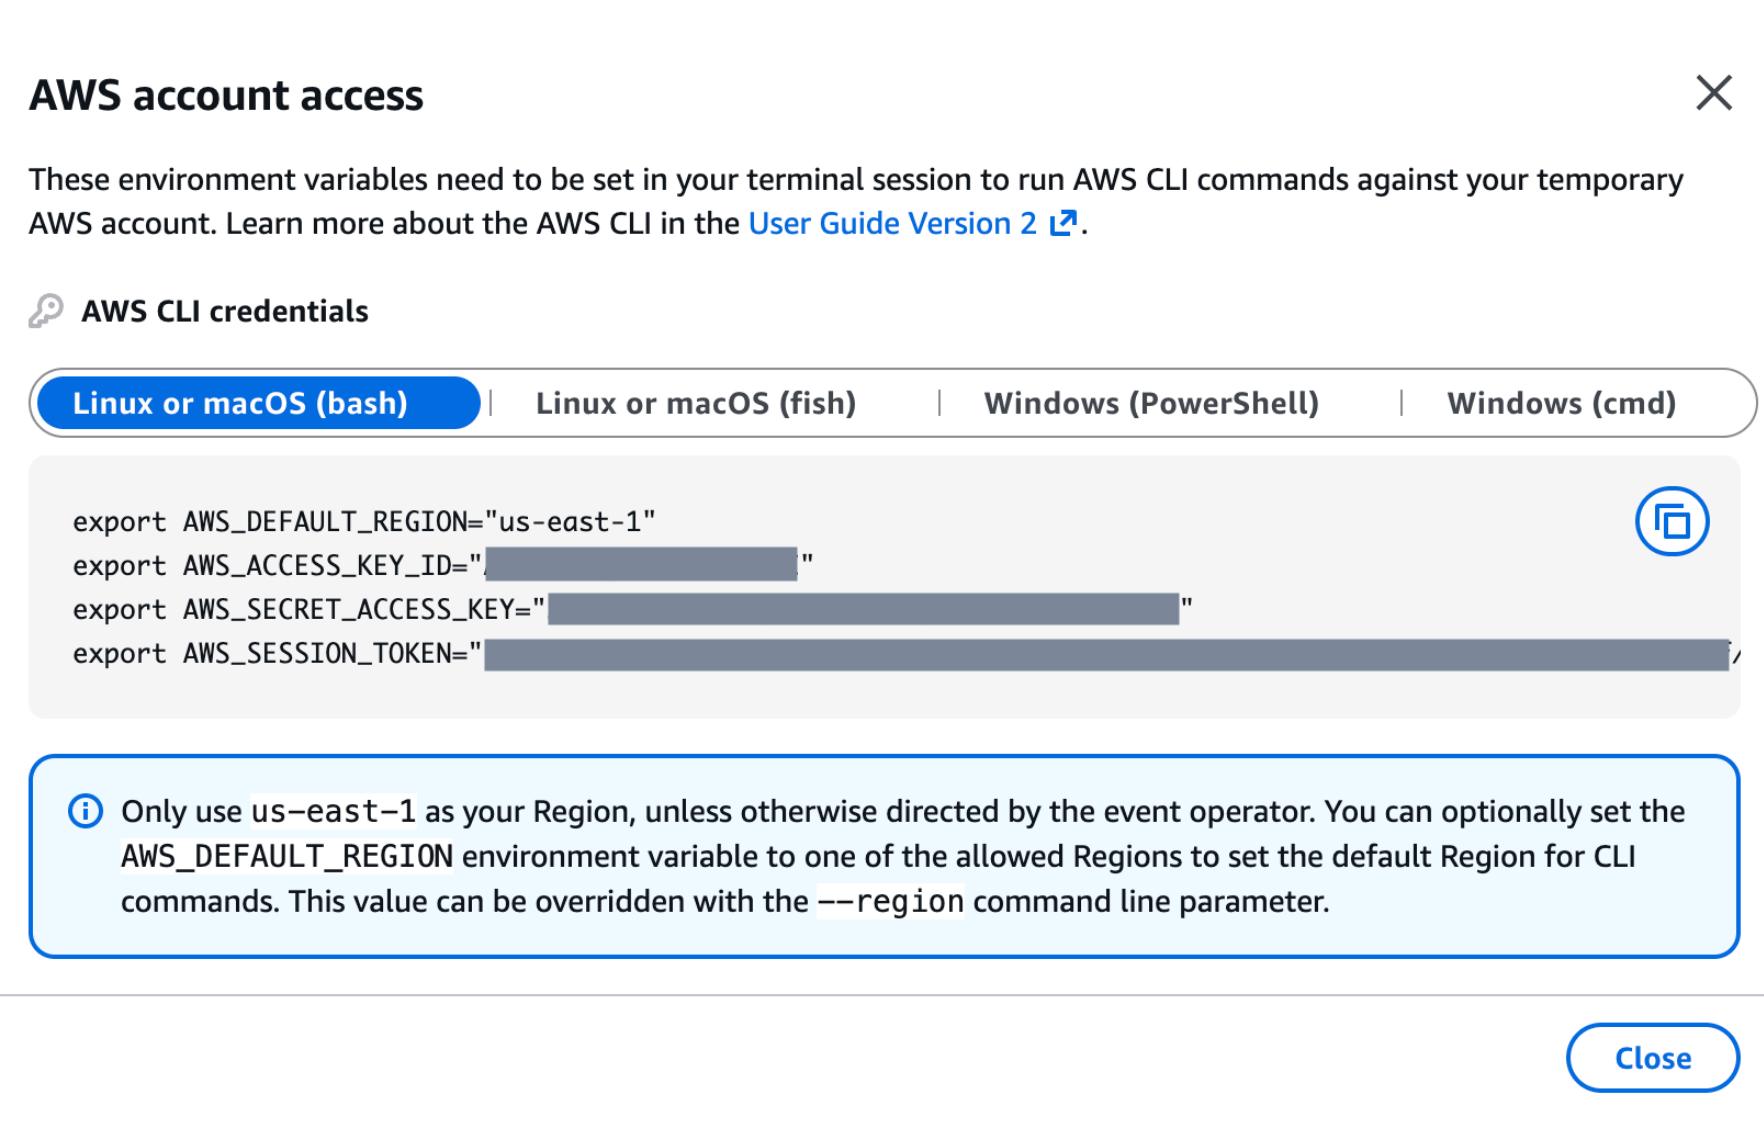

Step 3: Configure AWS CLI Credentials in Kiro

Now that you have access to your Workshop Studio account, configure AWS CLI credentials in Kiro IDE.

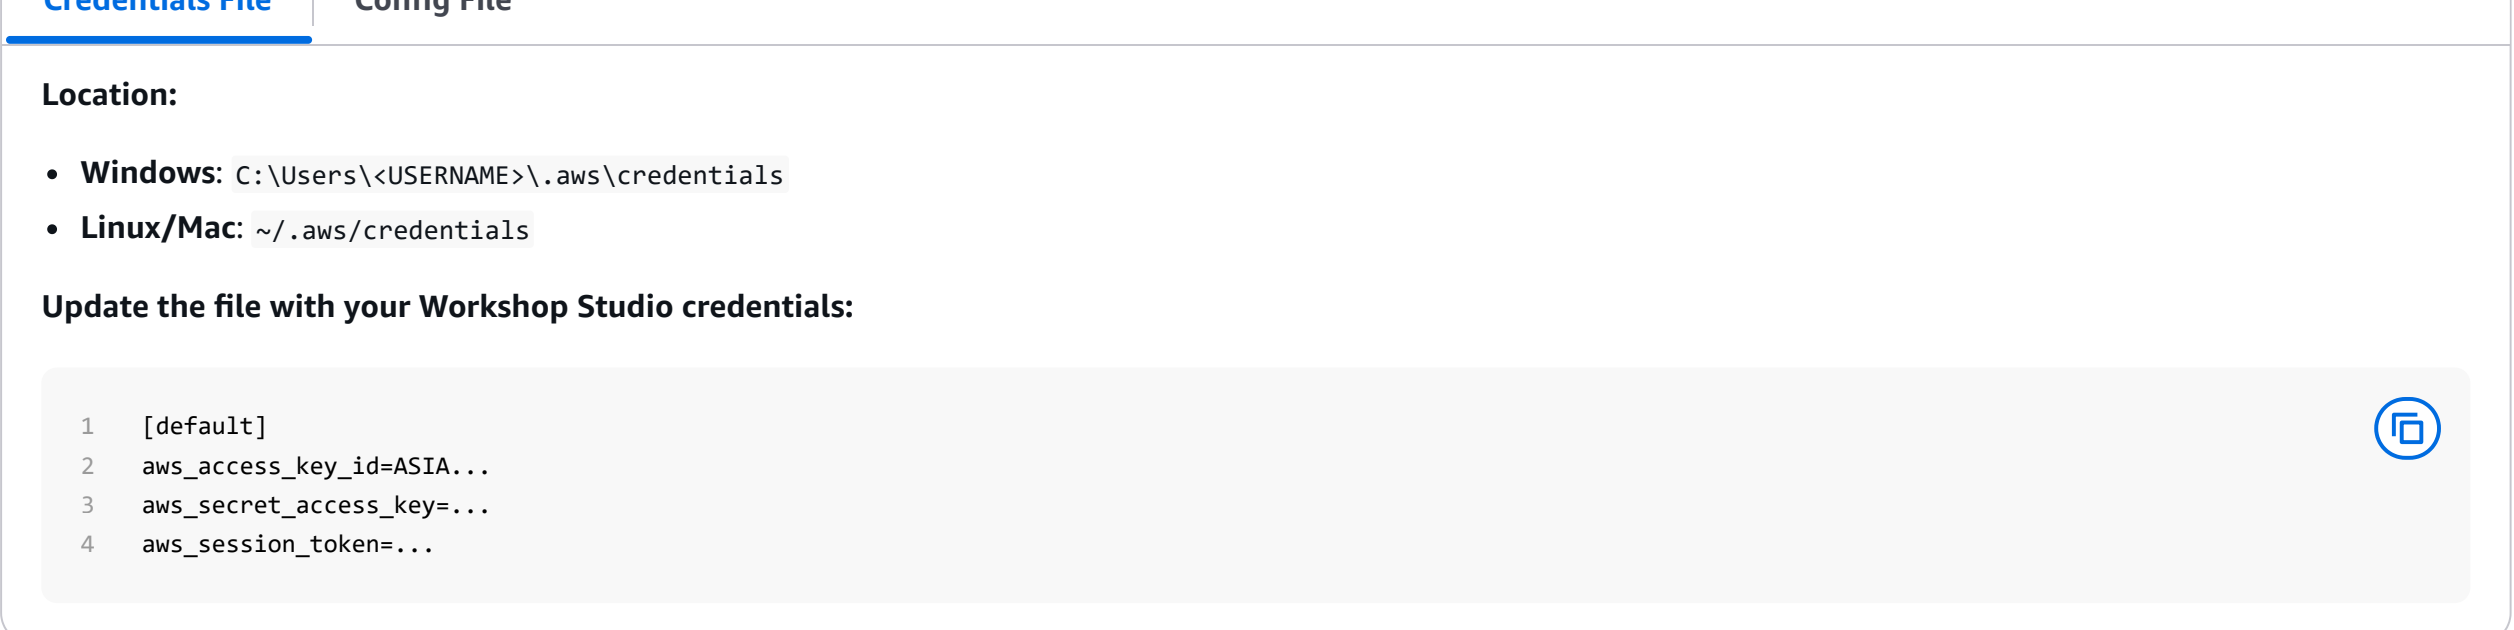

Get Credentials from Event Engine

- **Backup Your Existing Credentials**
Before proceeding, create a backup of your existing AWS credentials and config files to restore them after the workshop.

1. From the Event Engine dashboard, click on **Get AWS CLI credentials** link
2. You will see a **AWS account access** pop up to copy the credentials.

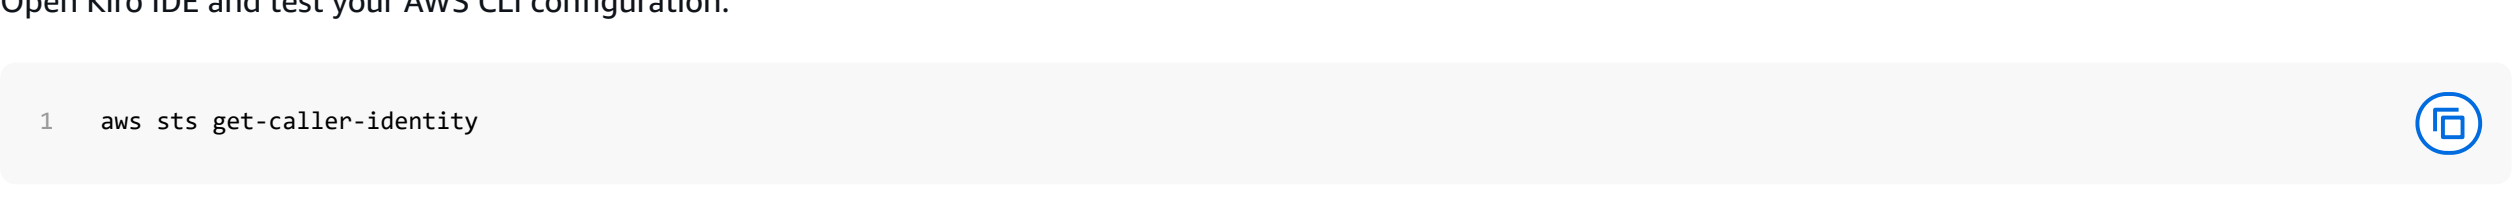

Update AWS Configuration Files

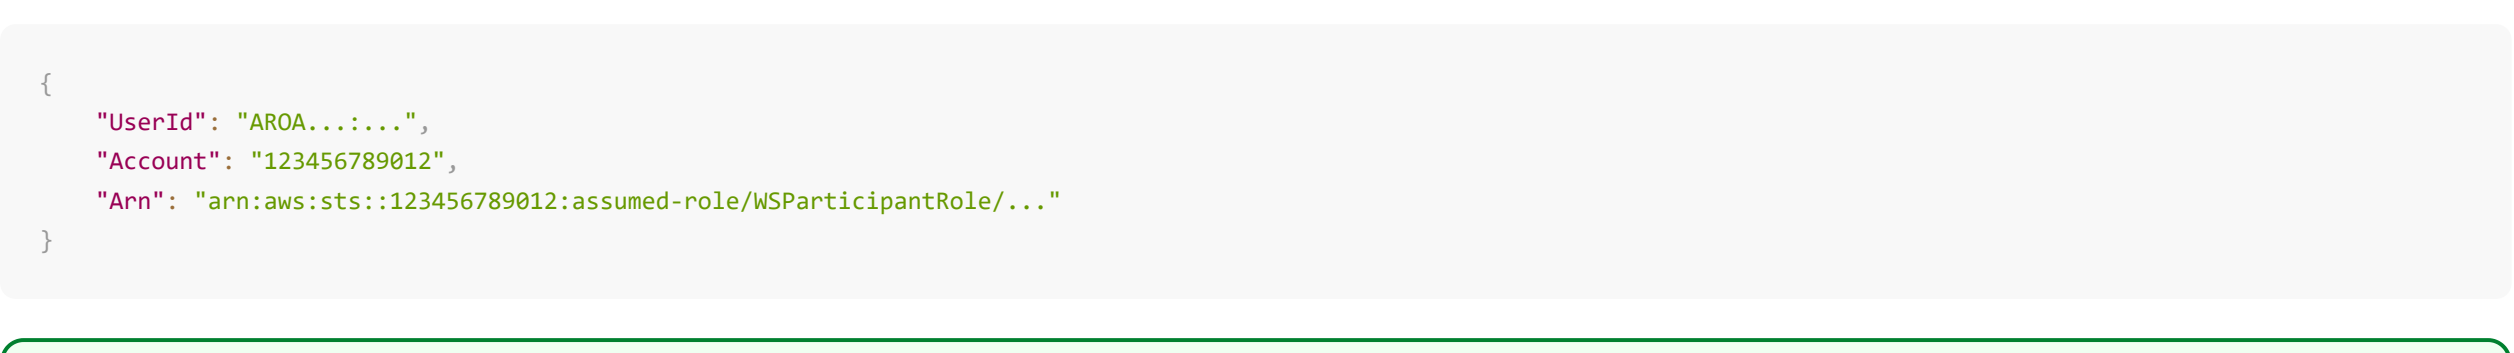

Verify Configuration

Open Kiro IDE and test your AWS CLI configuration:

Expected Output:

You should see output showing your temporary account details:

- **Configuration Complete**
Your Kiro IDE is now configured to use your Workshop Studio AWS account. You can proceed with the workshop exercises.

Important Considerations

Session Duration

- **Temporary Credentials**
Workshop Studio credentials are temporary and typically expire after a few hours. If your credentials expire during the workshop:
 1. Return to the Event Engine dashboard
 2. Click **AWS Console** again to refresh your session
 3. Get new CLI credentials if needed

Resource Cleanup

- All resources created during the workshop will be automatically deleted when the event ends
- Do not use Workshop Studio accounts for production workloads
- Save any important work or code to your local machine before the event concludes

Permissions

Workshop Studio accounts come with pre-configured permissions that:

- Allow you to complete workshop exercises
- Restrict certain AWS services or actions for security
- Are designed specifically for the workshop content

If you encounter permission errors, consult with the workshop facilitator.

Troubleshooting

Cannot Access Event Engine Dashboard

AWS CLI Commands Fail

Permission Denied Errors

Summary

You have successfully completed the Workshop Studio account setup:

- ☒ Accessed your Workshop Studio event through the join URL
- ☒ Authenticated using Email OTP
- ☒ Accepted workshop terms and conditions
- ☒ Accessed the Event Engine dashboard
- ☒ Opened the AWS Management Console as WSParticipantRole
- ☒ Configured AWS CLI credentials in Kiro IDE
- ☒ Verified your AWS account access

Your temporary Workshop Studio account is now ready for the workshop exercises. Remember that all resources will be automatically cleaned up when the event ends.

Next Steps

With your Workshop Studio account configured, you're ready to begin the workshop exercises!
