

To complete this workshop, you need access to an AWS account with appropriate permissions. This section covers two options for accessing AWS:

- 1. **Workshop Studio Provisioned Account** - For participants attending AWS-hosted events
- 2. **Your Own AWS Account** - For self-paced learners using their personal AWS account

Choose Your Path

Select the option that matches your workshop participation:

- Attending an AWS-hosted event? Use the Workshop Studio account
- Learning on your own? Use your personal AWS account

Prerequisites

Regardless of which option you choose, you'll need:

- [AWS CLI](#) installed on your local machine
- Kiro IDE installed and authenticated (see previous section)
- Basic familiarity with AWS services

Workshop Studio Provisioned Account

If you're attending an AWS-hosted event, you'll receive a temporary AWS account through Workshop Studio. This account:

- Comes pre-configured with necessary permissions
- Requires no credit card or payment
- Automatically cleans up resources after the event
- Provides an isolated environment for safe experimentation

Your Own AWS Account

If you're completing this workshop at your own pace, you can use your personal AWS account. Requirements:

- An AWS account with **PowerUserAccess** or **AdministratorAccess** permissions
- AWS CLI configured with valid credentials
- Responsibility for any AWS costs incurred during the workshop

[View Own Account Setup Instructions](#)

AWS Costs

When using your own account, you are responsible for any AWS service costs. Most workshop resources fall within the AWS Free Tier, but charges may apply depending on your account age and usage.

Next Steps

After setting up your AWS account credentials:

1. Verify AWS CLI configuration
2. Test connectivity to AWS services
3. Proceed to the workshop exercises
