

In this section, we will learn how to do "vibe coding" with Kiro. Vibe coding refers to an AI-assisted software development approach where AI generates, refines, and debugs code based on natural language prompts. We will not cover the technical details behind Kiro. But rather, we focus on teaching you how to use Kiro to build cool stuff.

This is a fully hands-on workshop. Through a series of exercises, you will design, develop, and deploy a chatbot service. By the end, you'll have a fully functional chatbot with text, image, and voice capabilities, secured with user authentication.

The (focused) time needed to complete all the exercises is 6 to 10 hours.
