

Common Questions

Q: Which approach is better?

A: Neither is universally better - they serve different purposes. Vibe coding is better for exploration and quick results, while spec coding is better for serious applications and long-term projects.

Q: Do I need to know how to code to use either approach?

A: No! Both approaches are designed for people without coding experience. Kiro handles all the technical implementation.

Q: Can I change my mind after starting?

A: Yes, but it's easier with vibe coding. With spec coding, major changes require updating the specifications first.

Q: Which approach costs more?

A: Spec coding typically uses more AI processing time upfront for planning, but may save time and money in the long run by avoiding rebuilds and changes.

Q: How do I know if my idea is too complex?

A: Start with vibe coding to explore. If Kiro struggles or you find yourself wanting more control over specific details, that's a sign to consider spec coding.
