

Conclusion

Both vibe coding and spec coding are powerful ways to bring your ideas to life with Kiro. The key is choosing the right approach for your specific situation:

- **Vibe coding** is perfect for exploration, learning, and quick results
- **Spec coding** is ideal for serious applications, business use, and long-term projects

Remember, you're not locked into one approach forever. Many successful projects benefit from using both - starting with vibe coding to explore possibilities, then moving to spec coding to build the final, polished version.

The most important thing is to start building. Whether you choose vibe or spec coding, Kiro makes it possible to turn your ideas into reality without needing years of technical training.
